

**PROGRAM** : NATIONAL DIPLOMA  
ENGINEERING: MECHANICAL

**SUBJECT** : HYDRAULIC MACHINES III

**CODE** : MHM 301

**DATE** : MAIN EXAMINATION  
21 NOVEMBER 2019

**DURATION** : 12:30 – 15:30

**WEIGHT** : 60% OF SEMESTER MARK

**TOTAL MARKS** : 100 MARKS

---

**Examiner** : MR VT. HASHE  
**Moderator** : MR S. SIMELANE

---

**INSTRUCTIONS:**

1. PLEASE ANSWER ALL QUESTIONS NEATLY
  2. SHOW ALL CALCULATIONS
  3. ANSWERS WITHOUT UNITS WILL BE PENALIZED
  4. NUMBER YOUR ANSWERS STRICTLY ACCORDING TO THE QUESTION
- 

**NUMBER OF PAGES** : 10 (Including cover page and 6 pages of Annexures)

**QUESTION 1**

A local ventilation system (hood and exhaust duct) is used to remove air and contaminants produced by a dry-cleaning operation (Fig 1). The duct is round and is constructed of galvanized steel with longitudinal seams and with joints every 0.76 m. The inner diameter (ID) of the duct is  $D = 0.230$  m, and its total length is  $L = 13.4$  m. There are five CD3-9 elbows along the duct. The equivalent roughness height of this duct is 0.15 mm, and each elbow has a minor (local) loss coefficient of  $K_L = C_0 = 0.21$ . Note the notation  $C_0$  for minor loss coefficient, commonly used in the ventilation industry (ASHRAE, 2001). To ensure adequate ventilation, the minimum required volume flow rate through the duct is  $Q = 600$  cfm (cubic feet per minute), or  $0.283$  m<sup>3</sup>/s at 25°C. Literature from the hood manufacturer lists the hood entry loss coefficient as 1.3 based on duct velocity. When the damper is fully open, its loss coefficient is 1.8. A centrifugal fan with 9.0-in inlet and outlet diameters is available. Its performance data are shown in Table 1, as listed by the manufacturer.

Predict the operating point of this local ventilation system, and draw a plot of required and available fan pressure rise as functions of volume flow rate. Is the chosen fan adequate?

Table 1

$Q$ , m <sup>3</sup> /s	$H_{\text{available}}$ , m

**QUESTION 2**

The 12.75 impeller option of the Taco Model 4013 FI Series centrifugal pump of Fig.2 is used to pump water at 25°C from a reservoir whose surface is 15 m above the centreline of the pump inlet. The piping system from the reservoir to the pump consists of 3.2 m of cast iron pipe with an ID of 101.6 mm and an average inner roughness height of 0.508 mm. There are several minor losses: a sharp-edged inlet ( $K_L = 0.5$ ), three flanged smooth 90° regular elbows ( $K_L = 0.3$  each), and a fully open flanged globe valve ( $K_L = 6.0$ ). Estimate the net positive suction head ( $NPSH_{\text{required}}$ ),

**[15]****QUESTION 3**

A centrifugal blower rotates at 1750 rpm (183.3 rad/s). Air enters the impeller normal to the blades and exits at an angle of 40° from radial. The inlet radius is 4 cm, and the inlet blade width is 5.2 cm. The outlet radius is 8 cm, and the outlet blade width is 2.3 cm. The volume flow rate is 0.13 m<sup>3</sup>/s. For the idealized case, i.e., 100 percent efficiency, calculate the net head produced by this blower in equivalent millimetres of water column height. Also calculate the required brake horsepower in watts.

**[10]****QUESTION 4**

Water flows in a channel whose bottom slope is 0.002 and whose cross section is as shown in Fig. 4. The dimensions and the Manning coefficients for the surfaces of different subsections are also given on the figure. Calculate the flow rate through the channel when the flow depth is 3.5 m, as well as the effective Manning coefficient for the channel.

*Figure 4.***[25]**

**QUESTION 5**

After graduation, you work for a pump manufacturing company. One of your company's best-selling products is a water pump, which we shall call pump A. Its impeller diameter is  $D_A = 6$  cm, and its performance data when operating at  $n_A = 1725$  rpm ( $\omega_A = 180.6$  rad/s) are shown in Table 5. The marketing research department is recommending that the company design a new product, namely, a larger pump (which we shall call pump B) that will be used to pump liquid refrigerant R-134a at room temperature. The pump is to be designed such that its best efficiency point occurs as close as possible to a volume flow rate of  $V_B = 2400$  cm<sup>3</sup>/s and at a net head of  $H_B = 450$  cm (of R-134a). The chief engineer (your boss) tells you to perform some preliminary analyses using pump scaling laws to determine if a geometrically scaled-up pump could be designed and built to meet the given requirements.

- Plot the performance curves of pump A in dimensional form
- Calculate the required pump diameter  $D_B$  and rotational speed  $n$

Table 5

$\dot{V}$ , cm <sup>3</sup> /s	$H$ , cm	$\eta_{\text{pump}}$ , %
100	180	32
200	185	54
300	175	70
400	170	79
500	150	81
600	95	66
700	54	38

Loss coefficients  $K_L$  of various pipe components for turbulent flow (for use in the relation  $h_L = K_L V^2 / (2g)$ , where  $V$  is the average velocity in the pipe that contains the component)\*

<b>Pipe Inlet</b> Reentrant: $K_L = 0.80$ ( $t \ll D$ and $l \approx 0.1D$ ) 	<b>Sharp-edged:</b> $K_L = 0.50$ 	<b>Well-rounded (<math>r/D &gt; 0.2</math>):</b> $K_L = 0.03$ <b>Slightly rounded (<math>r/D = 0.1</math>):</b> $K_L = 0.12$ (see Fig. 8-39) 
<b>Pipe Exit</b> Reentrant: $K_L = \alpha$ 	<b>Sharp-edged:</b> $K_L = \alpha$ 	<b>Rounded:</b> $K_L = \alpha$ 

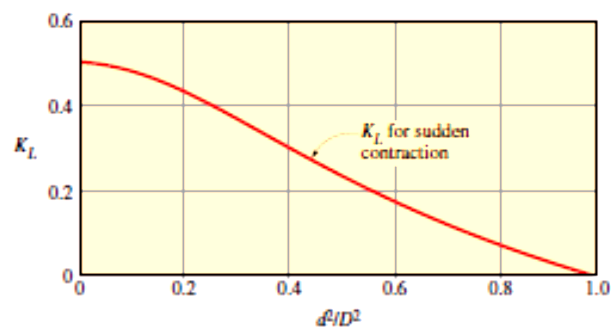

Note: The kinetic energy correction factor is  $\alpha = 2$  for fully developed laminar flow, and  $\alpha \approx 1.05$  for fully developed turbulent flow.

**Sudden Expansion and Contraction (based on the velocity in the smaller-diameter pipe)**

Sudden expansion:  $K_L = \alpha \left(1 - \frac{d^2}{D^2}\right)^2$

Sudden contraction: See chart.

**Gradual Expansion and Contraction (based on the velocity in the smaller-diameter pipe)**

Expansion (for  $\theta = 20^\circ$ ):

$K_L = 0.30$  for  $d/D = 0.2$

$K_L = 0.25$  for  $d/D = 0.4$

$K_L = 0.15$  for  $d/D = 0.6$

$K_L = 0.10$  for  $d/D = 0.8$

Contraction:

$K_L = 0.02$  for  $\theta = 30^\circ$

$K_L = 0.04$  for  $\theta = 45^\circ$

$K_L = 0.07$  for  $\theta = 60^\circ$
