| CODE | MEVMS 2B |
| DATE | SUPPLEMENTARY EXAMINATION 09 JANUARY 2020 |
| DURATION | (SESSION 2) 11:30-14:30 |
| WEIGHT | $40: 60$ |
| TOTAL MARKS | 100 |
| ASSESSOR | MR K S PHOGOLE |
| MODERATOR | MISS Z MDLULI |
| NUMBER OF PAGES | 5 PAGES |
| INSTRUCTIONS | 1. ANY CALCULATOR IS ALLOWED |
|  | 2. SKETCHES ARE NOT DRAWN TO SCALE <br> 3. DRAWING INSTRUMENTS ARE ALLOWED |

## INSTRUCTIONS TO CANDIDATES:

1. PLEASE ANSWER ALL THE QUESTIONS.
2. NUMBER THE QUESTIONS CLEARLY.
3. SHOW ALL STEPS IN THE CALCULATIONS.
4. MARKS WILL BE ALLOCATED FOR NEATNESS AND CHECKS

## QUESTION 1

The following is a record of the sampling of the core and sludge recovered from a borehole sunk through a copper-bearing lode at right-angles to its plane.
Calculate the average width and average value of the lode from the following information:

| Record of Core | Pull 1 | Pull 2 | Pull 3 |
| :--- | :---: | :---: | :---: |
| Length of Core | 7.6 m | 6.9 m | 8.2 m |
| Mass of Core | 160 kg | 143 kg | 171 kg |
| Mass of Sludge | 175 kg | 159 kg | 189 kg |
| Assay Value of Core (\% Cu ) | $4.7 \%$ | $4.3 \%$ | $3.6 \%$ |
| Assay Value of Sludge (\% Cu ) | $4.9 \%$ | $4.1 \%$ | $3.8 \%$ |
| Core Recovery | $100 \%$ | $100 \%$ | $100 \%$ |

## QUESTION 2

| A gold mine records the following results:- |  |  |
| :---: | :---: | :---: |
| Tons milled | $=$ | 90000 t |
| Surface sorting | = | $10 \%$ at $1.4 \mathrm{~g} / \mathrm{t}$ |
| Development | = | 7000 t at $12.0 \mathrm{~g} / \mathrm{t}$ |
| Stoped from pay blocks | = | 77840 t at $16.00 \mathrm{~g} / \mathrm{t}$ |
| Unpay blocks | = | 3336 t at $5.00 \mathrm{~g} / \mathrm{t}$ |
| N.I.R | = | 1751 t at $14.00 \mathrm{~g} / \mathrm{t}$ |
| Other sources | = | 751 t |
| Waste broken in stopes | = | 8000 t |
| Packed underground in stopes | = | 2000 t at $2.00 \mathrm{~g} / \mathrm{t}$ |

## Headgear bins:

| Beginning of month | $=$ | 2000 t at $14.00 \mathrm{~g} / \mathrm{t}$ |
| :--- | :--- | ---: |
| End of month | $=$ | 2900 t |

## Mill Bins :

| Beginning of month | $=$ | 3000 t at $13.00 \mathrm{~g} / \mathrm{t}$ |
| :--- | ---: | ---: |
| End of month | $=$ | 4000 t |

Gold Recovered
$=$
945.296 kg

Residue value
$=$
$0.30 \mathrm{~g} / \mathrm{t}$

## Calculate:

a) Tonnage discrepancy
b) Recovery factor
c) The MCF

## QUESTION 3

A reef drive has advanced 32 m during the month.
Using the following information calculate:
a) The tonnage trammed if 30 cm of ballast was left behind to grade the tracks for 30 m . The last two metres of the face does not have ballast
b) The gold content of the rock trammed
c) The value of all the rock broken.

## Information:

Reef Width $=24 \mathrm{~cm}$
Reef Value $=19.7 \mathrm{~g} / \mathrm{t}$
Dimentions of the reef drive are 3.0 m Wide and 2.8 m High
Dip of the reef $=16^{\circ}$
RD of rock in situ $=2.83 \mathrm{t} / \mathrm{m}^{3}$ and RD of broken rock $=1.7 \mathrm{t} / \mathrm{m}^{3}$

## Question 4

A gold mine milling 150000 tons per month intends to increase both the amount of development ore to the mill and the rate of surface sorting. It is also intends to reduce the amount of external waste in stoping operations underground. The mine also intends to increase the milling rate to $\mathbf{1 8 0} \mathbf{0 0 0}$ tons by drawing additional tons from a surface stock pile. The amount drawn from the stock pile is 20000 tons at a value of $6.25 \mathrm{~g} / \mathrm{t}$. To further enhance the value of tons broken in stopes, $5 \%$ was sorted and packed underground at a value of $0.11 \mathrm{~g} / \mathrm{t}$.

By how much will the milling grade and the recovery grade be affected if the milling rate of 180000 tons/month is maintained but the following changes are made.

Does the mine have to increase or decrease the area stoped and if so by how much area?
a) The average stoping width is reduced from 129 cm to 119 cm .
b) Ore hoisted from development is increased from $5000 \mathrm{t} / \mathrm{month}$ at a value of $5,50 \mathrm{~g} / \mathrm{t}$. to $9000 \mathrm{t} / \mathrm{month}$ at a value of $5,00 \mathrm{~g} / \mathrm{t}$.
c) Surface sorting is increased from $15 \%$ of the ore received at a value of $1,2 \mathrm{~g} / \mathrm{t}$. to $20 \%$ of the total ore received at a value of $1,5 \mathrm{~g} / \mathrm{t}$.

## GIVEN:

Present ore reserve stope value $=12,55 \mathrm{~g} / \mathrm{t}$ at a block width of 125 cm
Block Factor is $90 \%$

## There is no tonnage discrepancy.

M.C.F. $=95 \%$, Plant recovery Factor $=97,5 \%$ neither will change .

Reclamation tonnage of $6000 \mathrm{t} / \mathrm{month}$ at a value of $7,5 \mathrm{~g} / \mathrm{t}$ will be maintained.
Calculate the final values correct to $0,001 \mathrm{~g} / \mathrm{t}$.

## QUESTION 5

A gold mine is reaching the end of its life and no longer does development, has the following fully exposed sources of ore.

Payable Mineral Reserves 3680000 tons at $6,2 \mathrm{~g} / \mathrm{t}$
Marginal Unpay Block 845000 ton at $3,5 \mathrm{~g} / \mathrm{t}$
The following data is available:
Residue value $0,26 \mathrm{~g} / \mathrm{t}$
M.C.F. $98 \%$

It is intended to mine total of 100000 tons per month
Surface sorting $20 \%$ at $0,44 \mathrm{~g} / \mathrm{t}$
Shortfall 3\%
Other sources waste 7\%
Working costs R95 per ton milled
Price of gold R28 000/kg

It has been decided to mine the marginal Unpay blocks together with the payable blocks until they are exhausted, but a profit of R40,00 per ton milled must be maintained during this period.

Calculate:

1. How long will it take to exhaust the marginally unpay block?
2. For how long will the mine be able to continue at the same rate when only the payable blocks are available?
(20)

## QUESTION 6

A gold mine is working three different reefs and mines a total of 150000 tons per month from the stope faces on these reefs.

Information regarding the reefs is shown below.

| Reef | Tons Available | Stope width | Stope value |
| :--- | :---: | :---: | :---: |
|  | $(\mathrm{t})$ | $(\mathrm{cm})$ | $(\mathrm{g} / \mathrm{t})$ |
| A | 6560000 | 160 | 6,8 |
| B | 7840000 | 140 | 8,4 |
| C | 2400000 | 125 | 11,6 |

$14 \%$ of the total tonnage must be mined from reef C.
Calculate what tonnage must be mined from the reefs A and B in order to achieve an average of $8,0 \mathrm{~g} / \mathrm{t}$ for the 150000 tons mined each month.
