| 3 | 10 |  |
| 4 | 5 |  |
| 5 | 10 |  |
| Total: | 50 |  |

Question 1 (15 marks)
This question concerns the Bloch sphere and the rotation matrices.
(a) Calculate the eigenvectors of the three Pauli matrices, $X, Y, Z$. Draw the Bloch sphere and indicate the positions of each eigenvector on the Bloch sphere.
(b) Rotate the vector

$$
\frac{1}{\sqrt{2}}\binom{1}{-1}
$$

by an angle $\pi / 2$ about the $z$-axis. Where is this new vector on the Bloch sphere?
(c) What is the net effect of the product $R_{x}(\pi / 2) R_{x}(2 \pi / 3)$ ?

Question 2 ( 10 marks)
The Deutsch Algorithm, as shown below for two qubits, can be used to determine global properties of a function, $f$. For example, it can determine if the function $f:[0,1] \longrightarrow[0,1]$ is balanced or constant.
(a) Calculate the final state of the system if the function $f$ is balanced, just before the measurement, $M$ ?
(b) Explain how the measurement $M$ on the top qubit will determine whether $f$ is balanced or constant.

Question 3 (10 marks)
This question concerns the Schmidt decomposition.
(a) What is the Schmidt decomposition for the state

$$
|\psi\rangle=\frac{1}{2}(|00\rangle-|01\rangle-|10\rangle+|11\rangle) ?
$$

(b) What is the Schmidt decomposition for the state

$$
|\psi\rangle=\frac{1}{2}(|00\rangle+i|11\rangle) ?
$$

Question 4 (5 marks)
Draw the quantum circuit necessary to produce the Bell state $\left|\Phi_{00}\right\rangle=\frac{1}{\sqrt{2}}(|00\rangle+|11\rangle)$.
How should this circuit be modified to then produce the Bell state $\left|\Phi_{01}\right\rangle=\frac{1}{\sqrt{2}}(|01\rangle-|10\rangle)$ ? Draw this circuit.

Question 5 (10 marks)
The following circuit implements the quantum teleportation algorithm.

The top two registers belong to Alice and the bottom one belongs to Bob. Alice and Bob share the entangled state $\left|\Phi_{1}\right\rangle=\frac{1}{\sqrt{2}}(|00\rangle+|11\rangle)$. Alice wants to transmit the qubit $|\psi\rangle=\alpha|0\rangle+\beta|1\rangle$ to Bob using the above circuit.
(a) Calculate the overall state just before Alice performs the measurements $M_{1}$ and $M_{2}$.
(b) Say Alice performs a measurement on her two qubits and obtains the result
$M_{1}=1, M_{2}=0$. What is the probability of obtaining this result? Describe the transformation that Bob must now apply to his qubit to obtain the desired state $\psi$.

## Bonus Question

For an extra 5 marks, consider the circuit below,

and calculate the output state for the input state $\left|j_{1} j_{2} j_{3}\right\rangle=|100\rangle$.
